

## **Intellectual Property and cultural understanding in low resourced languages**

“Intellectual property is an important legal and cultural issue. Society as a whole has complex issues to face here.” - *Tim Berners-Lee*

Intellectual Property in a general point of view can be defined as a creative output resulting from ideas, information, and knowledge which can be considered as a trademark commodity in science and business.

What are different types of intellectual property and what do the research field and culture have to do with it?

Using the example of a case study on minority and endangered languages and cultures localized in an area between Iran, Armenia, Turkey, Azerbaijan, and Iraq, different types of Intellectual Property will be discussed, as well as methods to approach intellectual property in different cultures and language communities from a local perspective and how we can link this to Western ethics.

By acquiring an empirical knowledge on the topic, you can use the methods in your research as well as your prospective start-up plans. You will learn various types of practicing intellectual properties, for example how to collect data and make it publicly available without harming your project or others' rights. Consequently, these practices will be very useful in your future career either as a PhD or an entrepreneur.
